Typical soaps and synthetic detergents have the ability to form micellar solutions at concentrations within the limits 0.3 to 6 g/l, and are capable of dissolving colloidally a considerable quantity of hydrocarbons and polar substances. The efficiency of soaps and detergents can be quantitatively characterised by an unbiased measurement of their colloidal solubility and critical concentration of micelle-formation (CCM). Optimum cleansing action is achieved by aqueous solutions of detergents at concentrations (Chemistry--Physical, TT, v. 5, no. 7) (over)
